                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and imputed treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Single

They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.

The invention relates to isolated polynucleotide (I) and C polypeptide (II) sequences. (I) is useful as hybridisation probes, C polypeptide chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The C polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating classing of sites expressing (II). (I) and (II) are useful for treating the polypeptide and polypucleotide sequences have applications in the polypeptide and polypucleotide sequences have applications in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Š

                                                                                                                                                                                                                                                                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                          WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                          N-PSDB; AAS79688

                A cDNA library constructed from foetal ganglioside mRNA was screened with a butyryl-cholinesterase (bCh) cDNA probe to identify one clone (clone 14) contg. about 250 bases at the 5'-region of the bCh coding sequence plus a sequence which hybridised with genomic DNA from patients with acute myelocytic leukaemia. AAP95268 is the translation of the upper reading frame and is claimed in the patent. Its nucleic acid can be isolated, opt. together with its signal sequence, by screening cDNA or genomic libraries with the clone 14 DNA, to identify a full-length clone. The material from this clone can be transferred into mammalian or microbial host cells and these cultured for its prodn. It has hormonal activity in modulation of haematopoiesis and immune responses. It is useful in standard immunoassy or hybridisation procedures for the production and diagnosis of rare leukaemias. It may also be useful
                                                                                                                                                                                                                                                                                                                                                                                                     Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EP354989-A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABB61040
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                The sequence data for this patent did not form specification, but was obtained in electronic fat ftp.wipo.int/pub/published_pct_sequences.
                                                            capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

The inventuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL1016176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation;

The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.

New isolated polynucleotide and encoded polypeptides, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents the sAFP8 clone corresponding to a novel skin intracellular antifreeze polypeptide (AFP) which induces a concentration dependent decrease in the freezing point of an aqueous solution. This novel polypeptide does not contain a signal sequence and is thought to be intracellular. AFP's can be used to make an aqueous composition resistant to freezing by changing its thermal hysteresis such as a water or salt solution, an intracellular compartment of a cell or a food stuff, e.g. recrystalisation during cold storage, improving the texture and palatability of the food and has antibacterial properties. Such polypeptides can also be expressed to provide cold resistance to cells, e.g. plant, fungal animal or bacterial cells. The antibodies can be used to identify and isolate AFP while its promotter can be used to direct expression of a nucleic acid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Qγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polynucleotifes are also used in diagnostics as expressed sequence tags (for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this pattent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at first, wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG1840-ABLIG175) and the encoded proteins (ABB5737-ABB72072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

hemagglutinin precursor influenza A virus (strain A/Mem/102/72)

N;Contains: hemagglutinin HAI; hemagglutinin HAZ

C;Species: influenza A virus

C;Accession: A94441; A04051

R;Sleigh, M.J.; Both, G.W.; Brownlee, G.G.; Bender, V.J.; Moss, B.A.

in Structure and Variation in Influenza Virus, Laver, G., and Air, G., eds., pp. 69-79, E

A;Title: The haemagglutinin gene of influenza A virus: nucleotide sequence analysis of c

A;Reference number: A94441

A;Accession: A94441

A;Accession: A94441

A;Molecule type: genomic RNA

A;Residues: 1-566 <SLE>
C;Superfamily: influenza virus hemagglutinin

C;Keywords: hemagglutinin; homotrimer; lipoprotein; thiolester bond

F;1-16/Domain: signal sequence *status predicted <HAI>
F;346-566/Product: hemagglutinin HAI *status predicted <HAI>
F;355,562,565/Binding site: palmitate (Cys) (covalent) *status predicted

           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CELL RECEPTORS AND FOR INITATING INFECTION.
SUBUNIT: HOMOTRIMER. EACH OF THE MONOMERS IS FORMED BY TWO
(HA1 AND HA2) LINKED BY A DISCLFIDE BOND.
SIMILARITY: BELONGS TO THE INFLUENZA HEMAGGLUTININ FAMILY.

-!- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VCELL RECEPTORS AND FOR INITIATING INFECTION.

-!- SUBUNIT: HOMOTRIMER. EACH OF THE MONOMERS IS FORMED BY TWO (HA1 AND HA2) LINKED BY A DISULFIDE BOND.

-!- SIMILARITY: BELONGS TO THE INFLUENZA HEMAGGLUTININ FAMILY.

        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                  Score

-!- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VIRUS
CELL RECEPTORS AND FOR INITIATING INFECTION (BY SIMILARITY).
-!- SUBUNIT: HOMOTRIMER. EACH OF THE MONOMERS IS FORMED BY TWO CHAI
(HAI AND HA2) LINKED BY A DISULFIDE BOND (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE INFLUENZA HEMAGGLUTININ FAMILY.

I- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VIRUS TO CELL RECEPTORS AND FOR INITIATING INFECTION (BY SIMILARITY).

CELL RECEPTORS AND FOR INITIATING INFECTION (BY SIMILARITY).

CELL RECEPTORS AND FOR THE MONOMERS IS FORMED BY TWO CHAINS (HAI AND HAZ) LINKED BY A DISULFIDE BOND (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  N

B. (eds.);
SYMPOSIUM OF THE SOCIETY FOR GENERAL MICROBIOLOGY, pp.285-311,
Cambridge University Press, New York (1981).
-1- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VIRUS TO
CELL RECEPTORS AND FOR INITIATING INFECTION (BY SIMILARITY).
-1- SUBUNIT: HOMOTRIMER. EACH OF THE MONOMERS IS FORMED BY TWO CHAINS
(HALLAND HA2) LINKED BY A DISULFIDE BOND (BY SIMILARITY).

"A common neutralizing epitope conserved between the hemagglutinins of influenza a virus H1 and H2 strains.";

J. Virol. 67:2552-2558(1993).

-i- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VIRUS TO CELL RECEPTORS AND FOR INITIATING INFECTION (BY SIMILARITY).

CELL RECEPTORS AND FOR INITIATING INFECTION (BY SIMILARITY).

-i- SUBUNIT: HOMOTRIMER. EACH OF THE MONOMERS IS FORMED BY TWO CHAINS (HAI AND HA2) LINKED BY A DISULFIDE BOND (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Viruses; ssRNA negative-strand viruses; Orthomyxoviridae; Influenza virus A and B group; Influenza A viruses.
